

Foam packaging User's information

EPS cups and containers are suitable for most kinds of food served both – cold and hot. The suggested temperature interval for steady contact with foam is from -50C to +85C, however, EPS cups can be safely filled with boiling water as it cools down very rapidly.

EPS does not have any influence on the taste or smell of food, even in case the cups or containers are printed. Foam is not toxic or allergenic in any way.

Foam packaging should not be used in microwaves or ovens. Special care is advised when used for serving food with high grease content. The same refers to citrus oils. In case of use for natural lemon tea the lemon rind may cause destruction of the cups wall. However, even under this conditions no styrene is released into the liquid. Synthetic lemon tea (powder or tea bag) are save in this aspect.

More information upon use of EPS-packaging can be found in the internet.
